Nasdaq: PTN

CORPORATE PRESENTATION
September 2026

Carl Spana, Ph.D.
President & CEO

Stephen T. Wills, CPA/MST
CFO / COO

Forward Looking Statements

The statements in this presentation that relate to future plans, events or performance are forward-looking statements, which are made pursuant to the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended. Such forward-looking statements involve significant risks and uncertainties, and actual results, events and performance may differ materially from those expressed or implied in this presentation. We have based these forward-looking statements largely on our current expectations and projections about future events and financial trends that we believe may affect our financial condition, results of operations, business strategy and financial needs. These forward-looking statements include, but are not limited to, statements concerning the following: (i) estimates of our expenses, future revenue and capital requirements; (ii) our ability to obtain additional funding on terms acceptable to us, or at all; (iii) our ability to advance product candidates into, and successfully complete, clinical trials; (iv) the initiation, timing, progress and results of future preclinical studies and clinical trials, and our research and development programs; (v) the timing or likelihood of regulatory filings and approvals; (vi) our expectation regarding timelines for development of our other product candidates; (vii) the potential for commercialization of our other product candidates, if approved for commercial use; (viii) our ability and the ability of our licensees to compete with other products and technologies similar to our product candidates; (ix) the ability of third party collaborators to timely carry out their duties under their agreements with us and our licensees; (x) the ability of contract manufactures to perform their manufacturing activities in compliance with applicable regulations; (xi) our ability to recognize the potential value of our licensing arrangements with third parties; (xii) the potential to achieve revenues from the sale of our product candidates; (xiii) our ability to maintain product liability insurance at a reasonable cost or in sufficient amounts, if at all; (xiv) the retention of key management, employees and third-party contractors; (xv) the scope of protection we are able to establish and maintain for intellectual property rights covering our product candidates and technology; (xvi) our compliance with federal and state laws and regulations; (xvii) the timing and costs associated with obtaining regulatory approval for our product candidates; (xviii) the impact of legislative or regulatory healthcare reforms in the United States; and (xix) other risks disclosed in our SEC filings. The forward-looking statements in this presentation do not constitute guarantees of future performance. We undertake no obligation to publicly update these forward-looking statements to reflect events or circumstances that occur after the date of this presentation.

Company Profile

Technology platform – targeting the melanocortin system

MC4R agonists therapeutics for syndromic and genetic obesity

Demonstrated expertise moving programs from discovery to FDA approval

Expertise in the biology and chemistry of melanocortin system (MCS)

1st company to gain FDA approval for a melanocortin agent - Vyleesi® for female sexual dysfunction

MOA with potential to modify underlying disease pathologies – not just treat symptoms

Strategy leverages our expertise across multiple therapeutic opportunities

Palatin Leadership

Strong team, with broad and extensive biopharma experience

Carl Spana, PhD

President and Chief Executive Officer

Co-founder with 25-plus years in drug research, development, approval and board directorships

Stephen T. Wills, CPA/MST

*Chief Financial Officer and
Chief Operating Officer*

25-plus years in finance, operations, M&A, licensing, capital markets and board directorships

John Dodd, PhD

*Senior Vice President
Research / Development*

40-plus years in drug discovery and development

Shankar Venkatraman, PhD

*Vice President
Preclinical Development*

20-plus years in drug discovery and medicinal chemistry

Stephen A. Slusher

Chief Legal Officer

30-plus years of legal leadership with a focus on Intellectual property

Robert Jordan

*Senior Vice President
Program Operations*

20-plus years in drug development and clinical operations

James Hattersley

*Senior Vice President
Business Development*

25-plus years of identifying and executing deals

Development Programs

Novel 'next generation' MC4R selective agonists for treatment of rare neuroendocrine diseases

Therapies for patients with obesity caused by an impaired leptin melanocortin-4 receptor (MC4R) pathway

Focus on hypothalamic obesity (HO), Prader-Willi syndrome (PWS), and Bardet-Biedl syndrome (BBS)

Product / Administration	R&D Pre-clinical	Phase 1	Phase 2	Phase 3	NDA	Status / Next Steps
Peptide MC4R Selective Agonist Once-weekly injection						Identify optimal compound 2H 2026 IND enabling – CMC activities ongoing Phase 1 SAD/MAD healthy obese patients Start 1H 2027 / Data 2H 2027
Oral Small Molecule MC4R Selective Agonist Daily dosing						Identify optimal compound 1H 2027 Phase 1 SAD/MAD healthy obese patients Start 2H 2027 / Data 1H 2028

HO, PWS and BBS patients to be included in Phase 2/3 studies / programs

MC4R Obesity Programs

MC4R pathway regulates obesity and energy management through satiety & food intake

Central leptin-melanocortin pathway is a critical pathway that regulates feeding and body weight to maintain energy homeostasis

Disruption of this pathway, whether acquired or genetic, produces severe, treatment-resistant obesity

Novel "Next Generation" MC4R Selective Agonists

Strategy / Focus

Advancing **three distinct and complementary treatment approaches** to developing highly selective MC4R agonists:

- Non-lipidated peptide program (PL1000 series)
- Lipidated peptide program (PL2000 series)
- Oral small-molecule program

Developing next-generation, **best-in-class MC4R therapies**

- Designed to improve potency, tolerability, and long-term usability
- Achieved through enhanced receptor selectivity and reduced off-target effects

The background of the slide features abstract, overlapping geometric lines in red, blue, and purple, creating a complex, crystalline pattern. These lines form various shapes, including triangles and polygons, and are distributed across the top and right portions of the slide.

Rare MC4R Pathway Diseases

- *Hypothalamic Obesity (HO)*
- *Prader-Willi Syndrome (PWS)*
- *Bardet-Biedl Syndrome (BBS)*

Hypothalamic Obesity (HO)

A rare, acquired form of obesity following injury to the hypothalamus or congenital

- **Acquired HO**

- Craniopharyngioma — brain tumors near the hypothalamus and pituitary gland
- Treatment (tumor resection, radiation, or both) can damage the hypothalamus, disrupting MC4R signaling and causing reduced energy, hyperphagia and rapid-onset, severe obesity

- **Congenital HO**

- Hypothalamic dysfunction from a genetic disorder that can similarly disrupt the MC4R signaling pathway
- Causing reduced energy, hyperphagia and rapid-onset, severe obesity

Prader-Willi Syndrome (PWS)

A complex, multi-system disorder

- **Two genetic origins**
 - ~70% of cases: paternal chromosome 15 deletion in the critical region
 - ~30% of cases: maternal uniparental disomy of chromosome 15
- **Clinical Hallmark**
 - Hyperphagia — **continuous, extreme hunger**; patients never feel full
 - Slow metabolism drives easy weight gain on a fraction of typical caloric intake
 - Leading genetic cause of life-threatening childhood obesity

Bardet-Biedl Syndrome (BBS)

Affects multiple organ systems, significant morbidity and reduced quality of life

- **A multi-system ciliopathy**
 - Rare genetic disorder from mutations affecting cilia function
 - Severe early-onset obesity driven by hyperphagia and impaired satiety
 - Also affects vision, cognition, kidneys and extremities
- **MC4R-linked, metabolically severe**
 - Obesity in BBS is linked to dysfunction of the MC4R pathway
 - Elevated risk of type 2 diabetes, cardiovascular disease and fatty liver disease
 - Tolerability and usability are critical to therapy adherence

Rare MC4R Pathway Diseases - Prevalence

High, Unmet, and Unsatisfied Need

DISEASE	EST. U.S. PREVALENCE	EST. EUROPEAN PREVALENCE	EST. GLOBAL PREVALENCE
Hypothalamic Obesity (acquired) * ** ***	5,000–10,000	5,000–10,000	—
Prader-Willi Syndrome ****	~20,000	—	~400,000
Bardet-Biedl Syndrome *****	4,000–5,000	4,000–5,000	50,000–80,000

MC4R agonism is a validated target. Patients require life-long treatment, are easily identified, and are already engaged with the health system, receiving specialist care for endocrine complications.

* U.S. estimates based on reported incidence of HO following craniopharyngioma and long-term survival rates, (Zacharia, et al., Neuro-Oncology 14(8):1070–1078, 2012. doi:10.1093/neuonc/nos142; and Muller, et al., Neuro-Oncology 17(7), 1029–1038, 2015 doi:10.1093/neuonc/nov044.).

** European estimates limited to the EU4 (Germany, France, Spain, Italy), UK and the Netherlands and prevalence of 0.1-0.3 in 10,000 patients.

*** Palatin estimates the prevalence of acquired HO in Japan to be approximately 5,000 to 7,500 based on our review of certain data; Prevalence is 2-3 times higher than in the USA & Europe due to a higher reported frequency of craniopharyngioma.

**** Estimated based on published prevalence rates and global population assumptions.

***** Estimated based on published prevalence rates and global population assumptions.

Melanocortin-4 Receptor (MC4R) Obesity Programs

- *Novel “Next Generation” MC4R Selective Agonists*
 - *Peptides - Once Weekly Dosing*
 - *Oral Small Molecules – Daily Dosing*

Melanocortin-4 Receptor (MC4R) Obesity Programs

- *Novel “Next Generation” MC4R Selective Agonists*
 - *Peptides - Once Weekly Dosing*

Novel "Next Generation" MC4R Selective Peptide Agonists

Legacy challenges of MC4R peptide agonists have been solved

Current Therapy Challenges

Injection Frequency

Palatin's high-potency compounds with structural elements extend drug residency time (≥ 1 week)

Skin Pigmentation

Multiple structural elements identified by Palatin that demonstrate reduced MC1R agonism (a known contributor to hyperpigmentation)

Nausea / Vomiting

Palatin R&D has identified multiple approaches to reduce gastrointestinal adverse events

Cardiovascular Effects

Palatin structure-function studies have identified achievable modifications that eliminate cardiovascular effects

Palatin Achieved Solutions

Novel "Next Generation" MC4R Selective Peptide Agonists

First series / Second series

First series of 'next generation' MC4R peptide agonists for obesity:

- Palatin studies in MC4R knock-out models confirm weight loss is dependent on a functional MC4R
- Next-generation class lead development candidate
 - Selective MC4R agonist: Significant multiples of binding selectivity for MC4R over MC1R
 - Protein binding tail added for extended duration
 - Efficacy in weight loss and food intake and without blood pressure effects
 - Confirms validity of structure/function relationships
 - ✓ New compounds extend the selectivity for MC4R over MC1R

Second series of 'next generation' MC4R peptide agonists for obesity:

- Palatin has generated novel structures/compounds that highly selective for MC4R over MC1R
 - Extended *in vivo* stability allows for 1x weekly dosing
 - Hyperpigmentation minimized, potentially eliminated

Novel "Next Generation" Selective MC4R Peptide Agonists

Palatin compounds reduce / (potentially) eliminate MC1R agonism

Agonist	MC4R EC ₅₀ (E _{max})	MC4R Selectivity ^a
Bremelanotide	5.01 nM (91%)	0.05
Setmelanotide	0.66 nM (98%)	0.61
PL8905	4.99 nM (88%)	6.05
PL1000	<25 nM (>90%)	Not an agonist @ MC1R
PL2000	<25 nM (>90%)	Not an agonist @ MC1R

← PL1000/PL2000 MC1R
Binding Ki > 2uM

- MC1R agonism results in skin darkening
- Bremelanotide is FDA approved for treating hypoactive sexual desire disorder in women
- Setmelanotide is FDA approved for treating several orphan obesity indications

Dose-Dependent Efficacy of PL1000 in Diet-Induced Obese Mice

- PL1000 produced dose-dependent reductions in body weight and food intake ($p < 0.05$ and $p < 0.0001$ vs. vehicle), supporting continued development of PL1000

Cardiovascular Safety of PL1000 in Dog at Exposure-Matched Doses

Systolic Blood Pressure

Heart Rate

Diastolic Blood Pressure

PL1000 showed no blood pressure/CV effects in dog at tested exposures

Single Dose of PL2000 in DIO Mice

Equivalent efficacy to BID Dosing of positive control PL8905

- PL2000 reduced body weight by 8.0% and 24-hr food intake by 34% vs. vehicle ($p < 0.01$), equivalent to positive control PL8905

Novel "Next Generation" MC4R Selective Peptide Agonists

Activities – long-acting once weekly administration SC peptides

Advancing two complementary selective MC4R peptide series

- **Non-lipidated** PL1000 and **lipidated** PL2000

- Compounds from both peptide series have demonstrated:
 - Potent MC4R agonist activity and are not agonists at MC1R, supporting Palatin's objective to minimize or potentially eliminate MC1R-mediated hyperpigmentation
- **Lead lipidated MC4R peptide** development candidate
 - Demonstrated **significant reductions in food intake and body weight with once-weekly** subcutaneous dosing in a diet-induced obese mouse model
 - Preclinical pharmacokinetic data support the potential for once-weekly or less frequent dosing in humans
 - IND-enabling and CMC activities are ongoing
- **Lead non-lipidated MC4R peptide** development candidate
 - Established the feasibility of once-weekly subcutaneous dosing and working to optimize a controlled-release formulation
- **Novel intellectual property** covering composition of matter

Melanocortin-4 Receptor (MC4R) Obesity Programs

- *Novel “Next Generation” MC4R Selective Agonists*
 - *Oral Small Molecules – Daily Dosing*

Melanocortin-4 Receptor (MC4R) Obesity Programs

*MC4R selective **oral small molecule program** for treatment of rare MC4R pathway diseases*

Current Therapy Challenges

Injection Frequency

Skin Pigmentation

Nausea / Vomiting

Cardiovascular Effects

Palatin Achieved Solutions

Palatin identified small molecules show excellent preclinical oral bioavailability

Palatin small molecules interact weakly with MC1 receptors, and with limited potential to cause skin pigmentation

Palatin research has identified multiple approaches, including compound structure and/or formulation, to reduce GI AEs

Multiple structural features in Palatin compounds have demonstrated the ability to eliminate cardiovascular effects

Small Molecule Program

Novel “next generation” MC4R selective agonists: understanding what is required for success

Historically, MC4R small molecule programs have failed due to a lack of understanding the receptor biology and the structure/function relationship that determine weight loss versus side effects.

Target profile for orally active selective MC4R agonist:

- Optimal PK curve for max therapeutic window
- Properties required for a successful oral small molecule
 - ✓ Molecular weight
 - ✓ Polar surface area
 - ✓ hERG activity
 - ✓ Human plasma protein binding
 - ✓ CYP activity
- MC4R mechanism-based weight loss
- Limited MC1R activity (hyperpigmentation minimized)
- No sexual or blood pressure effects
- Clean 28-day rat tox study
- Novel IP

- Current efforts
 - Improving PL7737 chemotype
 - Exploring multiple new chemotypes

Multiple Small-Molecule Chemotypes Demonstrate Strong MC4R Selectivity

>300-fold MC1R binding selectivity achieved across distinct chemical series

Agonist	MC4R EC ₅₀ (E _{max})	MC1R/MC4R binding Selectivity ^a
Bremelanotide	5 nM (91.0%)	0.05
Setmelanotide	0.66 nM (98.8%)	0.61
Series A	2 nM (66%)	40
Series B	10.5 nM (110%)	83
Series C	9.9 nM (115%)	333
Series D	10.1 nM (100%)	200

- Multiple differentiated chemotypes achieve up to >200-fold MC1R/MC4R binding selectivity
 - Providing multiple starting points for optimization toward a best-in-class small-molecule MC4R agonist
- SAR underway to identify a development candidate 1H 2027

^aSelectivity is defined as ratio of MC1R EC₅₀ to MC4R EC₅₀ (larger # is more MC4R relative to MC1R)

"Next Generation" MC4R Selective Oral Small Molecule Agonists

Activities – High MC4R potency and solving MC1R selectivity/activity

Palatin is developing **oral small-molecule** MC4R selective agonists as a **third** and complementary treatment **approach**

- Objective is to develop an oral MC4R agonist capable of delivering:
 - Comparable or greater efficacy with improved tolerability compared with emerging oral MC4R therapies, while limiting or avoiding MC1R agonism to minimize or eliminate hyperpigmentation
- Building on learnings from PL7737, and utilizing multiple drug-design approaches, including AI and ML tools
- Preclinical work has **identified candidates with improved potency and MC4R selectivity** relative to earlier compounds, along with favorable oral bioavailability
- MC4R selective oral small molecule candidates
 - **Low binding affinity for MC1R** >10,000nM K_i
 - While maintaining **high MC4R potency** EC_{50} <1nM, E_{max} >100%
- **Novel intellectual property** covering composition of matter

Melanocortin-4 Receptor (MC4R) Obesity Programs

Next steps and development timeline overview

Treating rare MC4R pathway diseases: primary focus on hypothalamic obesity (HO), Prader-Willi Syndrome (PWS) and Bardet-Biedl Syndrome (BBS)

MC4R selective agonists

- **Long-acting peptide (weekly SC administration)**
 - Phase 1 SAD/MAD start 1H 2027 / data 2H 2027
 - MAD in healthy obese patients
 - Phase 2/3 clinical study(ies) initiation (HO, PWS, BBS patients) targeted for 2H 2027
- **Oral (daily) small molecule**
 - Phase 1 SAD/MAD start 2H 2027 / data 1H 2028
 - MAD in healthy obese patients
 - Phase 2/3 clinical study(ies) initiation in HO, PWS, BBS patients targeted for 1H 2028

Strategic Opportunity in HO, PWS and BBS

- Clinically validated mechanism for safe, effective treatment of obesity
- Significant unmet need
- MC4R is a validated target
- Potential best-in-class MC4R long-acting peptide and oral small molecule therapies

MC4R Agonist Plus GLP-1/GIP For Generalized Obesity Management

- *Bremelanotide MC4R agonist Phase 1b clinical weight loss study in general obese subjects*
- *Co-administration of Bremelanotide MC4R & Tirzepatide (GLP-1/GIP)*
 - *Bremelanotide (BMT) MC4R Agonist*
 - ✓ *FDA Approved (Vyleesi® for Female HSDD)*

MC4R Agonist Generalized Obesity Management

Bremelanotide MC4R agonist obesity Phase 1b clinical weight loss study in general obese subjects

2-Week Study

- General obese subjects: BMI ~35
 - Bremelanotide: n=27
 - Vehicle: n=26
- Weight loss:
 - Placebo -0.7kg;
 - Bremelanotide: -2.2kg $p < 0.001$
- Bremelanotide reduction daily caloric intake ~400kcal $p < 0.01$
- Steady weight loss over the duration of treatment

MC4R Agonist Generalized Obesity Management

*GLP-1/GIP agonist + MC4R agonist: co-administration clinical data**

- No prospective studies have been done with combination pharmacotherapy
- Previously published combination of setmelanotide plus 2.5mg of tirzepatide for obesity in BBS
- 2 patients lost 26% in 34 weeks and 30% TBW at 52 weeks never moving past 2.5mg dose

Patient 1 change in BMI

Image 1: Rate of change of BMI in Patient 1 taking combination therapy over a 52-week period.

Patient 2 change in BMI

Image 2: Rate of change of BMI in Patient 2 taking combination therapy over a 34-week period.

MC4R Agonist Generalized Obesity Management

BMT-801 Phase 2 signal detection study objectives

Co-Administration GLP1/GIP Agonist Tirzepatide (2.5mg Weekly) + MC4R Agonist Bremelanotide (1.25mg Daily)

Main Research Questions

- Does co-administration result in increased weight loss?
- Does MC4R agonism blunt the weight regain seen post-incretin treatment?
- Evaluate the safety and tolerability of co-administration

Pro's

- Appropriate control arms included
- Co-administration arm powered to see a statistically significant weight loss effect
- Evaluating a comprehensive set of secondary end points

Limitations

- MC4R agonist given at a low dose 1x day in the morning
- Not powered for between arm comparisons
- Short duration of treatment

Combination therapy will be an important approach in helping many subjects reach their weight loss goals.

MC4R Agonist Generalized Obesity Management

BMT-801 Phase 2 signal detection study

Co-Administration GLP1/GIP Agonist Tirzepatide & MC4R Agonist Bremelanotide

Study Design: Randomized, double-blind, placebo-controlled trial evaluating the safety and efficacy of the addition of an MC4R agonist (BMT) to tirzepatide in n=96 obese subjects

Primary endpoint:	% change in weight loss tirzepatide/bremelanotide compared to pbo/pbo at week 8
Additive effect of BMT:	% of subjects with ≥5% weight loss at week 8 tirzepatide/bremelanotide compared to tirzepatide/pbo
	% subjects greater weight loss in Treatment Period 2 vs Treatment Period 1, tirzepatide/bremelanotide compared to tirzepatide/pbo
	% change in weight loss tirzepatide/bremelanotide compared to tirzepatide/pbo Treatment Period 2 (week 4–week 8)
Weight loss maintenance:	% change weight loss bremelanotide/pbo vs pbo/pbo (week 4-week 8)

MC4R Agonist Generalized Obesity Management

Co-administration additive effect – primary analysis

Analysis for Additive Effect Percent of Subjects with $\geq 4\%$ Reduction in Percent Weight Loss at End of Study

MC4R Agonist Generalized Obesity Management

Effect of co-administration on increased weight loss

- Comparison of Group 4 to Group 3 during Treatment Period 2 demonstrates a **weight loss maintenance effect**
- Comparison Group 1 to Group 2 at week-8 demonstrates **additive effect of co-administration**
- **Rapid weight regain seen post-treatment**

MC4R Agonist Generalized Obesity Management

BMT-801 MC4R/GLP-1-GIP co-administration detection study

Value of the study results and next steps
